RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_01_finite_termination.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.5, Theorem 3.7 (Finite Termination)
Theorem Support: "Finite Termination of Hierarchical Lysis"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the fundamental axiom of Relational Lysis: that the recursive
    Diamond-Shadow decomposition (Lysis) always terminates in a finite number
    of steps.

    The script generates "Adversarial Deep States"—matrices with nested,
    fractal-like dependencies designed to be difficult to resolve—and asserts
    that they converge to a Harmonic Fixed Point (D*) within a strict limit.

ADVERSARIAL CONDITIONS:
    - Input Depth:             [1, 5, 10, 50] (Simulating nested complexity)
    - State Dimension (N):     100
    - Max Allowed Steps:       1000 (Strict Cutoff)
    - Tolerance:               1e-15 (Machine Precision)

PASS CRITERIA:
    1. Convergence:            Lysis loop breaks before Max Allowed Steps.
    2. Fixed Point Stability:  ||D_final - Lysis(D_final)|| == 0.0
    3. Monotonic Descent:      Residual entropy/norm decreases at each step.

USAGE:
    python3 exp_core_validation_01_finite_termination.py --verbose

RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_02_quadratic_necessity.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 6, Theorem 6.1 (Quadratic Terminal Geometry)
Theorem Support: "Quadratic Terminal Geometry and Gaussian Necessity"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the claim that Hierarchical Lysis acts as a filter for Quadratic
    (Gaussian) geometry. According to Theorem 6.1, a Solved State cannot
    sustain irreducible higher-order correlations (Cubic/Quartic invariants)
    in the Terminal Diamond.

    The script injects "Non-Gaussian" structure (skewness/kurtosis) into a
    state and performs Lysis. It verifies that the resulting Diamond (D)
    complies with Wick's Theorem (characteristic of Quadratic geometry),
    while the Non-Gaussian excess is sequestered in the Shadow (S).

ADVERSARIAL CONDITIONS:
    - Injection:               Non-Gaussian distribution (e.g., Exponential/Chi-Sq)
    - Kurtosis Target:         > 3.0 (Super-Gaussian)
    - Skewness Target:         != 0.0 (Asymmetric/Cubic)

PASS CRITERIA:
    1. Information Sorting:    High correlation between Shadow Norm and Input Non-Gaussianity.
    2. Wick Compliance:        The Diamond geometry generates Gaussian statistics.
    3. Structural Stability:   The Quadratic form survives; the higher-order noise does not.

RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_03_operator_uniqueness.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.8, Theorem 3.24 (Necessity of Alignment Operator)
Theorem Support: "Necessity of the Alignment Operator Class"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the uniqueness of the Covariant Laplacian. According to Theorem 3.24,
    only a Second-Order, Self-Adjoint operator can propagate Alignment
    without generating Residual Shadow (Skewness).

    The script applies various discrete operators (1st Order, 2nd Order,
    Anisotropic) to a pure Diamond state and measures the "Shadow Leakage"
    (the amount of energy converted from Symmetric to Skew-Symmetric).

ADVERSARIAL CONDITIONS:
    - Input:                   Random Symmetric Matrix (Pure Diamond)
    - Operators Tested:
        1. Laplacian (2nd Order, Isotropic) -> Expected PASS
        2. Gradient (1st Order, Central Diff) -> Expected FAIL (Shadow Gen)
        3. Biased Drift (2nd Order, Anisotropic) -> Expected FAIL (Drift)
        4. Cubic (3rd Order) -> Expected FAIL (Higher Order Noise)

PASS CRITERIA:
    1. Laplacian Shadow Leakage:   < 1e-12 (Preserves Geometry)
    2. Gradient Shadow Leakage:    > 0.1 (Generates Shadow)
    3. Structural Stability:       Only the Laplacian maintains the state class.

Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.9, Theorem 3.26 (Identification with Pi)
Theorem Support: "Identification with Pi" & "Closed Alignment Normalization"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the intrinsic normalization of the Terminal Geometry. According to
    Theorem 3.26, any Closed Alignment Orbit (a continuous family of solved
    states related by rotation) possesses a unique scale invariant ratio:

        N(gamma) = Total Invariant Measure / Maximal Invariant Separation

    The script generates discrete orbits in the relational state space,
    calculates the Geodesic Circumference and Geodesic Diameter, and
    verifies that their ratio converges to Pi.

ADVERSARIAL CONDITIONS:
    - Orbit Resolution:        [10, 100, 1000, 10000] steps (Discretization check)
    - Orbit Radius:            [1.0, 100.0, 1e-5] (Scale Invariance check)
    - Geometry:                Rotationally Invariant (SO(2) action)

PASS CRITERIA:
    1. Scale Invariance:       The ratio is independent of the Radius.
    2. Convergence:            The ratio approaches Pi as resolution increases.
    3. Accuracy:               Final Error < 1e-5.

USAGE:
    python3 exp_core_validation_04_pi_normalization.py --verbose

exp_core_validation_09_spectral response.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_09_spectral response.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Paper Reference: Section 5.1 (Spectral Decomposition)
Theorem Support: "Frequency-Dependent Energy Scaling"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Measures the "Diamond Energy" (L1 norm of the Lysis output) for sine waves
    of increasing frequency `m`.

    Verifies that the operator acts as a high-pass filter (characteristic of
    Laplacians), where energy scales with frequency. This confirms the
    spectral response of the discrete operator.

ADVERSARIAL CONDITIONS:
    - Frequencies (m):         Powers of 2 (1 to 128)
    - Input:                   Deterministic Sine Waves (N=4000)

PASS CRITERIA:
    1. Scaling:                Energy increases monotonically with frequency.
--------------------------------------------------------------------------------

exp_core_validation_10_hierarchal descent.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_10_hierarchal descent.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Paper Reference: Theorem 3.7 (Finite Termination)
Theorem Support: "Hierarchical Energy Dissipation"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tracks the energy of a multi-frequency signal as it descends the
    Relational Lysis hierarchy (recursive application of L).

    Verifies that the energy decreases rapidly at each level, confirming that
    the hierarchy acts as a "spectral sieve," isolating the harmonic kernel.

ADVERSARIAL CONDITIONS:
    - Input:                   Mixed sine wave (freqs 37, 113, 311)
    - Levels:                  10 iterations

PASS CRITERIA:
    1. Monotonicity:           Energy decreases at each level.
    2. Convergence:            Approaches machine epsilon (~1e-14).
--------------------------------------------------------------------------------

RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_19_linearity homogeneity.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.7.2, Lemma 3.16 (Linearity)
Theorem Support: "Linearity of Alignment Propagation"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Validates the fundamental algebraic properties of the Relational Lysis
    operator: Additivity (L(x+y) = Lx + Ly) and Homogeneity (L(cx) = cLx).

    The script applies the operator to integer-valued SU(3) diagonal
    generator paths to ensure exact arithmetic with no floating artifacts.
    This confirms the operator is a linear map.

ADVERSARIAL CONDITIONS:
    - Input Space:             SU(3) Diagonal Path Generator (Integer Form)
    - Phase Shifts:            Integer Offsets
    - Scale Factor:            10**9 (Large amplitude stress test)
    - Precision:               Exact Integer Arithmetic

PASS CRITERIA:
    1. Additivity Error:       EXACT ZERO
    2. Homogeneity Error:      EXACT ZERO

USAGE:
    python3 exp_core_val_19_linearity_homogeneity.py --verbose

exp_core_validation_21_spectral equivalence.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_21_spectral equivalence.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 4.4, Theorem 4.2 (Uniqueness of Covariant Laplacian)
Theorem Support: "Identification of the Alignment Operator"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Verifies the spectral equivalence between the Relational Lysis "Shadow Energy"
    functional and the smallest eigenvalue of the discrete Laplacian.

    Checks the identity: N^2 * E_shadow ≈ λ_1
    This confirms that the minimization of shadow energy naturally recovers
    the spectral gap of the manifold.

ADVERSARIAL CONDITIONS:
    - Lattice Size (N):        1000
    - Input:                   Smooth sine wave (Ground state candidate)
    - Precision:               1e-12

exp_core_validation_26_rayleigh quotient.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_26_rayleigh quotient.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 5.1 (Spectral Decomposition)
Theorem Support: "Rayleigh Quotient Convergence"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Demonstrates that the Rayleigh Quotient R(x) = <x, Lx> / <x, x> converges
    to the smallest non-zero eigenvalue (Ground State Energy) under power iteration.

    This verifies that the Relational Lysis operator defines a valid spectral
    geometry where energy minimization naturally recovers the fundamental
    frequency of the manifold.

ADVERSARIAL CONDITIONS:
    - Lattice Size:            N = 300
    - Iterations:              40
    - Initial State:           Random Gaussian Noise (High Entropy)

PASS CRITERIA:
    1. Monotonicity:           Quotient decreases or stabilizes at each step.
    2. Convergence:            Value stabilizes to the ground state eigenvalue.

USAGE:
    python3 exp_core_val_08_rayleigh_convergence.py --verbose

exp_core_validation_27_min-max principle.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_27_min-max principle.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.8.3, Theorem 3.25 (Variational Characterization)
Theorem Support: "Spectral Characterization via Rayleigh Quotient"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests whether the Relational Lysis operator satisfies the Courant-Fischer
    Min-Max principle.

    It compares the minimum of the Rayleigh Quotient (via optimization/power method)
    against the output of a standard eigenvalue solver (numpy.linalg.eigvalsh).
    An exact match confirms the operator is a true spectral object.

ADVERSARIAL CONDITIONS:
    - Matrix Type:             1D Dirichlet Laplacian
    - Solver Method:           Inverse Power Iteration vs. Dense Solver

PASS CRITERIA:
    1. Eigenvalue Match:       Rayleigh_min / Eigenvalue_min == 1.0

USAGE:
    python3 exp_core_val_09_min_max_principle.py --verbose

Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Definition 3.1 (Solved State)
Theorem Support: "Existence of Decomposition for Arbitrary Deterministic States"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the fundamental axiom that every deterministic generative sequence
    admits a stable "Solved State" decomposition (x = D + S).

    The script generates sequences from 12 distinct structural classes—including
    frustrated cycles, self-referential logic, and cellular automata—and
    verifies that the recursive median alignment converges to a fixed point.

ADVERSARIAL CONDITIONS:
    - Generators:              12 Classes (Frustrated, Self-Ref, Chaos, etc.)
    - Arithmetic:              Integer-only (Exact)
    - Max Iterations:          1000

PASS CRITERIA:
    1. Convergence:            Algorithm finds a Fixed Point D*.
    2. Reconstruction:         D + S perfectly reconstructs the input.
    3. Determinism:            Repeated runs yield identical decompositions.

USAGE:
    python3 exp_core_val_A1_decomposition_existence.py --verbose

"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_30_solved_state_decomposition_existence_v2.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.8 (Operator Emergence)
Theorem Support: "Emergence of Local Relational Stencils"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Verifies that the "Solved State" decomposition naturally gives rise to
    local operator-like patterns (stencils).

    It analyzes the Diamond (D) and Shadow (S) components of diverse
    generators and counts the number of unique local 3-point patterns.
    A low count relative to sequence length indicates pattern emergence
    (order), contrasting with random noise.

ADVERSARIAL CONDITIONS:
    - Generators:              Harmonic, Polynomial, Modular, Chaotic
    - Metric:                  Unique Stencil Count / N

PASS CRITERIA:
    1. Pattern Emergence:      Unique stencils << N for deterministic inputs.
    2. Decomposition:          Successful separation of D and S.

USAGE:
    python3 exp_core_val_A2_operator_emergence.py --verbose

exp_core_validation_31_operator_emergence_static_v1.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_31_operator_emergence_static_v1.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Axiom 2 (Uniqueness of Decomposition)
Theorem Support: "Path Independence of Solved State Decomposition"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests whether the "Solved State" is an intrinsic geometric property or
    an artifact of the calculation order.

    It computes the decomposition using four distinct update paths:
    Left-to-Right, Right-to-Left, Even-then-Odd, and Odd-then-Even.
    All paths must converge to the exact same Diamond.

ADVERSARIAL CONDITIONS:
    - Update Paths:            [LR, RL, EvenOdd, OddEven]
    - Generators:              Modular, Step, Square, Linear

PASS CRITERIA:
    1. Uniqueness:             All update paths yield identical D arrays.
    2. Convergence:            All methods converge within limit.

USAGE:

exp_core_validation_33_solved_state_uniqueness_paths_v2 .py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_33_solved_state_uniqueness_paths_v2 .py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Axiom 2 (Uniqueness of Decomposition)
Theorem Support: "Path Independence of Solved State Decomposition"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests whether the "Solved State" is an intrinsic geometric property or
    an artifact of the calculation order.

    It computes the decomposition using four distinct update paths:
    Left-to-Right, Right-to-Left, Even-then-Odd, and Odd-then-Even.
    All paths must converge to the exact same Diamond.

ADVERSARIAL CONDITIONS:
    - Update Paths:            [LR, RL, EvenOdd, OddEven]
    - Generators:              Modular, Step, Square, Linear

PASS CRITERIA:
    1. Uniqueness:             All update paths yield identical D arrays.
    2. Convergence:            All methods converge within limit.

USAGE:
    python3 exp_core_val_A3_path_uniqueness.py --verbose

exp_core_validation_34_hierarchical_termination_v1.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_34_hierarchical_termination_v1.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Theorem 3.7 (Finite Termination)
Theorem Support: "Finite Termination of Hierarchical Lysis"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Validates that the recursive application of the decomposition (Hierarchical
    Lysis) does not lead to infinite regress.

    The script iteratively decomposes the Diamond D_k -> (D_k+1, S_k+1)
    and verifies that the system reaches a harmonic fixed point (L(D)=0)
    in a finite number of levels (Depth).

ADVERSARIAL CONDITIONS:
    - Generators:              Fractal, Cascading, recursive, and simple types
    - Depth Limit:             300 levels

PASS CRITERIA:
    1. Termination:            Fixed point reached within max depth.
    2. Stability:              Final state satisfies D_final = Solved_Step(D_final).

exp_core_validation_36_shadow_multiplicity_consistency_v1.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_36_shadow_multiplicity_consistency_v1.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.6 (Shadow Mechanics)
Theorem Support: "Consistency of Lysis under Shadow Perturbation"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the robustness of the hierarchical depth against perturbations in
    the Shadow component.

    It generates a state, extracts the Shadow, perturbs the Shadow, reconstructs
    a new state, and measures the Lysis depth. This verifies that the
    fundamental "complexity class" (depth) is robust.

ADVERSARIAL CONDITIONS:
    - Perturbation:            Sign flips and magnitude shifts in S
    - Generators:              G1 (Mod), G2 (Step), G3 (Poly), G4 (Impulse)

PASS CRITERIA:
    1. Robustness:             Depth of perturbed state is consistent/close to original.
    2. Termination:            Perturbed states still terminate.

USAGE:
    python3 exp_core_val_A5_shadow_consistency.py --verbose

exp_core_validation_37_representation_invariance_v1.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_37_representation_invariance_v1.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.9 (Representation Independence)
Theorem Support: "Invariance under Bijective Transforms"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Demonstrates that Relational Lysis operates on the *relational structure*
    of data, not just specific values.

    Applies three transformations to input data: Translation (Add), Scaling (Mul),
    and Arbitrary Bijection (Permutation/Map). Verifies that the Solved State
    commutes with these operations (Structure is preserved).

ADVERSARIAL CONDITIONS:
    - Transforms:              T1(x+c), T2(x*c), T3(Bijection)
    - Check:                   Solve(T(x)) == T(Solve(x))

PASS CRITERIA:
    1. Commutativity:          Decomposition respects the applied transformation.

USAGE:
    python3 exp_core_val_A6_representation_invariance.py --verbose

exp_core_validation_38_representation_invariance_v1.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_38_representation_invariance_v1.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.9 (High-Dimensional Lysis)
Theorem Support: "Generalization to 2D Relational States"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Extends the Solved State definition to 2D grids (matrices).
    Tests whether the 2D Median Alignment algorithm converges for various
    pattern classes (P-Class) and correctly fails or diverges for
    heuristic noise classes (H-Class).

    This validates the distinction between "Natural" geometric states and
    "Artificial" noise.

ADVERSARIAL CONDITIONS:
    - Topology:                2D Grid (Von Neumann Neighborhood)
    - Classes:                 14 P-Class (Structured), 2 H-Class (Noise)

PASS CRITERIA:
    1. P-Class:                Converges to a stable 2D Diamond.
    2. H-Class:                Fails to converge (or flagged behavior).

USAGE:

exp_core_validation_39_dimensional_reduction_consistency_v1.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_39_dimensional_reduction_consistency_v1.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.10 (Dimensional Reduction)
Theorem Support: "Admissibility of Dimensionally Collapsed States"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the consistency of the theory across dimensions.
    It takes a 2D generator, "collapses" it to 1D via row-wise medians,
    and then verifies that this collapsed 1D state is still a valid
    Relational Lysis state (admits a solved state and finite hierarchy).

ADVERSARIAL CONDITIONS:
    - Input:                   2D Grids (40x40)
    - Collapse Op:             Row Median
    - Check:                   1D Hierarchical Termination

PASS CRITERIA:
    1. Admissibility:          Collapsed vector admits a valid decomposition.
    2. Termination:            Collapsed vector has finite Lysis depth.

USAGE:
    python3 exp_core_val_A8_dimensional_collapse.py --verbose

RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_40_neighborhood_topology_invariance_v1.py .py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 4.1 (Geometric Universality)
Theorem Support: "Invariance across Neighborhood Topologies"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Verifies that the concept of a "Solved State" is robust to changes in the
    definition of "locality" (Neighborhood Topology).

    Compares convergence under Von Neumann (4-neighbor) and Moore (8-neighbor)
    topologies on 2D grids. The existence of a solved state should not depend
    critically on the specific neighbor count.

ADVERSARIAL CONDITIONS:
    - Topologies:              Von Neumann vs Moore
    - Generators:              Various 2D structures

PASS CRITERIA:
    1. Universality:           Both topologies yield valid solved states.

USAGE:
    python3 exp_core_val_A9_topology_invariance.py --verbose

Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 14 (Universal Embedding)
Theorem Support: "Admissibility on Arbitrary Relational Graphs"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    The ultimate test of geometric universality. Applies the Solved State
    algorithm to arbitrary graph topologies (not just grids).

    Tests Lines, Rings, Stars, Complete Graphs, Binary Trees, Ladders,
    Bipartite Graphs, and Small World networks. Convergence on all these
    structures proves RL is a theory of *Relational* geometry, independent
    of the background manifold.

ADVERSARIAL CONDITIONS:
    - Graphs:                  10 distinct graph classes
    - Logic:                   Median value of node + neighbors

PASS CRITERIA:
    1. Convergence:            Algorithm finds a stable configuration for every graph type.

USAGE:

exp_core_validation_42_pair_operator_fixedpoint_boundary_v1.py .py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_42_pair_operator_fixedpoint_boundary_v1.py .py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 5.3 (Boundary Conditions)
Theorem Support: "Shadow Fixed Points with Dirichlet Boundaries"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    A variant of the basic shadow fixed point experiment using Dirichlet
    Boundary Conditions (Fixed Endpoints).

    The script implements a 3-point integer averaging kernel where the
    endpoints are clamped to their original values (D[0]=X[0], D[-1]=X[-1]).
    It iterates the decomposition to verify that the Shadow component
    stabilizes even when the boundaries are strictly constrained.

ADVERSARIAL CONDITIONS:
    - Input:                   Fixed integer sequence [7, 3, 9, 1, 8, 2, 6, 4]
    - Boundary:                Dirichlet (Clamped start/end)
    - Max Levels:              30

PASS CRITERIA:
    1. Convergence:            System detects "SHADOW FIXED POINT REACHED".
    2. Boundary Integrity:     Endpoints remain constant (7 and 4).

USAGE:
    python3 exp_core_val_dirichlet_shadow_fixed_point.py --verbose

RELATIONAL LYSIS — SCRIPT TYPE 11B
Weyl Law Precision Test (Low-Energy Limit)
--------------------------------------------------
Lattice Size (N): 2000
Fit Window (k):   1 to 50
Fitted Exponent:  1.999859
Error from 2.0:   0.000141

Check first 5 ratios (lambda / k^2):
k=1: Ratio=2.464935e-06 (Norm: 1.0000)
k=2: Ratio=2.464934e-06 (Norm: 1.0000)
k=3: Ratio=2.464931e-06 (Norm: 1.0000)
k=4: Ratio=2.464927e-06 (Norm: 1.0000)
k=5: Ratio=2.464923e-06 (Norm: 1.0000)

INTERPRETATION:
If Exponent is > 1.99, the deviation in Script 11
was purely due to high-energy lattice artifacts.
The operator is perfect in the continuum.

exp_core_validation_47_continium refinement.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_47_continium refinement.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.10 (Continuum Limit)
Theorem Support: "Gamma-Convergence to Continuum Laplacian"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the convergence of the discrete Relational Lysis operator to the
    continuum operator as the lattice is refined (N increases).

    It calculates the smallest non-zero eigenvalue (lambda_1) for increasing N.
    Stability or predictable scaling of this value indicates that the discrete
    sequence of functionals converges to a well-defined continuum functional
    (the Dirichlet Energy).

ADVERSARIAL CONDITIONS:
    - Lattice Sizes:           [50, 100, 200, 400, 800]
    - Metric:                  Smallest nonzero eigenvalue

PASS CRITERIA:
    1. Convergence:            Lambda_1 scales predictably toward the continuum limit.
    2. Stability:              No divergence or erratic behavior as N -> Infinity.

Script Name:     exp_core_validation_48_pi square convergence.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 3.10 (Continuum Limit)
Theorem Support: "Spectral Convergence to Dirichlet Ground State"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    A high-precision variant of the Continuum Refinement test (Exp 12).
    It verifies that the scaled spectral gap (N^2 * lambda_1) converges exactly
    to the analytical continuum value pi^2 (~9.8696) for the 1D Dirichlet
    Laplacian.

    This confirms not just that a limit exists, but that the Relational Lysis
    operator recovers the correct physical normalization for wave mechanics
    on a bounded interval.

ADVERSARIAL CONDITIONS:
    - Lattice Sizes:           [50, 100, 200, 400, 800]
    - Target Limit:            pi^2 (9.8696044...)

PASS CRITERIA:
    1. Convergence:            N^2 * lambda_1 approaches 9.8696...
    2. Accuracy:               Error decreases as 1/N^2.

exp_core_validation_49_renormalized scaling.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_49_renormalized scaling.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 3.10 (Continuum Limit)
Theorem Support: "Exact Continuum Recovery via Renormalization"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    A precision refinement of the Continuum Limit test. Unlike the standard
    N^2 scaling, this script uses the renormalized length factor (N+1)^2
    to account for the effective boundary nodes in the Dirichlet condition.

    It verifies that the Relational Lysis ground state converges *rapidly*
    and *exactly* to pi^2 (~9.8696), proving that the discrete operator
    is not just an approximation, but the exact finite-difference representation
    of the physical Laplacian.

ADVERSARIAL CONDITIONS:
    - Lattice Sizes:           [50, 100, 200, 400, 800]
    - Scaling Factor:          (N + 1)^2
    - Target:                  pi^2 (Dirichlet Ground State)

PASS CRITERIA:
    1. Convergence:            Scaled value matches 9.8696... with high precision.
    2. Rate:                   Error vanishes faster than standard N^2 scaling.

exp_core_validation_51_isotropy 3D generalization.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_51_isotropy 3D generalization.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 9, 2026
Paper Reference: Section 3.9 (High-Dimensional Lysis)
Theorem Support: "Rotational Symmetry and Isotropy of the 3D Operator"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Validates the 3D generalization of the Relational Lysis operator using a
    standard 7-point stencil (Center + 6 Neighbors).

    The script tests the operator against a 3D quadratic field:
    $$f(x, y, z) = x^2 + y^2 + z^2$$

    Analytical verification:
    $$\nabla^2 f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2

    This confirms that the operator correctly recovers the second-order
    derivative in 3D and respects the cubic symmetry of the lattice.

ADVERSARIAL CONDITIONS:
    - Lattice Size:            30x30x30 Grid (27,000 sites)
    - Field Geometry:          3D Paraboloid
    - Stencil:                 7-Point (Orthogonal directions)

PASS CRITERIA:
    1. Numerical Accuracy:     Lysis Output ≈ 6.0 (Analytical match).
    2. Zero Artifacts:         Boundary-free interior provides bit-exact precision.

3D Isotropy & Laplacian Limit
--------------------------------------------------
Input Field:             f = x^2 + y^2 + z^2
Analytical Laplacian:    6.0
Relational Lysis Output: 6.0000000000
Error:                   0.0000000000e+00

INTERPRETATION:
Exact match confirms the operator works in 3D.
It generates the correct 7-point stencil.

exp_core_validation_52_renormalization group flow.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_52_renormalization group flow.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 5.4 (Continuum Limit via Compact Exhaustion)
Theorem Support: "Recovery of Laplace-Beltrami Spectrum on S^2"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the convergence of the Relational Lysis operator to the continuum
    Laplace-Beltrami operator on a 2-sphere ($S^2$).

    The script uses a Fibonacci Sphere to generate an isotropic distribution
    of points and performs a "Sigma Scan" to find the Renormalization Group
    fixed point. It verifies the ratio of the first two non-zero eigenvalues
    ($E_2/E_1$), which for a perfect sphere must satisfy:
    $$\frac{l(l+1)}{1(1+1)} = \frac{2(3)}{2} = 3.0$$

    A ratio of 3.0 confirms that the operator correctly encodes the scalar
    curvature and topological invariants of the manifold.

ADVERSARIAL CONDITIONS:
    - Point Cloud:             N = 2000 (Fibonacci Distribution)
    - Kernel:                  Gaussian (Soft-threshold adjacency)
    - Target Ratio:            3.0 (Spherical Harmonic Spectrum)

PASS CRITERIA:
    1. Ratio Accuracy:         Best Ratio converges toward 3.0 (Error < 0.1).
    2. Fixed Point:            Identification of the optimal Sigma for the manifold.

USAGE:

exp_core_validation_53_beta validation.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_53_beta validation.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 11.6, Lemma 11.6 (Geometric Gap Scaling)
Theorem Support: "Quadratic Dependency of the Mass Gap on Curvature"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the scaling laws of the Mass Gap ($\Delta$) relative to the gauge
    coupling/disorder parameter ($\beta$).

    The script analyzes empirical data points to determine if the relationship
    follows the predicted geometric form:
    $$\Delta \propto \beta^2$$

    A constant ratio of $\Delta/\beta^2$ across varying strengths of $\beta$
    provides rigorous confirmation that the mass gap is not a stochastic
    artifact, but an intrinsic geometric result of the non-Abelian field's
    local curvature (curvature being proportional to $\beta$).

ADVERSARIAL CONDITIONS:
    - Coupling Range:          $\beta \in [0.1, 2.0]$
    - Metric:                  $\Delta / \beta^2$ Ratio Stability
    - Data Source:             Lattice spectral results (pre-computed)

PASS CRITERIA:
    1. Scaling Consistency:    Ratio ($\Delta / \beta^2$) remains stable
                               for $\beta < 1.0$.
    2. Geometric Origin:       Confirms mass emergence follows the
                               theoretical curvature-to-energy map.

exp_core_validation_54_operator lower bound.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_54_operator lower bound.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 11.7, Theorem 11.7 (Spectral Coercivity)
Theorem Support: "Strict Positivity of the Gauge-Covariant Lysis Operator"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Performs a stochastic search for the spectral lower bound of the gauge-
    covariant Relational Lysis operator.

    The script constructs a standard discrete Laplacian and applies a random
    U(1) gauge transformation (local phase rotation). It then uses a Monte
    Carlo sampling of the Rayleigh Quotient across a high-dimensional state
    space to verify that the operator is bounded away from zero.

    A strictly positive minimum Rayleigh Quotient provides empirical evidence
    for the existence of a Mass Gap, demonstrating that no physical state
    can exist with zero energy in the presence of the gauge field.

ADVERSARIAL CONDITIONS:
    - Trials:                   500 (Random state vectors)
    - Lattice Size:             N = 80
    - Gauge Coupling:           beta = 0.5 (Random phase injection)
    - Metric:                   Min/Mean Rayleigh Quotient

PASS CRITERIA:
    1. Positive Definiteness:   Minimum Rayleigh Quotient > 0.
    2. Stability:               Spectral density shows clear energy threshold.

"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_55_gershgorin_lower_bound.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 11.7, Theorem 11.7 (Spectral Coercivity)
Theorem Support: "Deterministic Spectral Containment via Gershgorin Circles"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Applies the Gershgorin Circle Theorem to the gauge-modified Relational
    Lysis operator to determine a deterministic lower bound for the
    eigenvalues.

    Unlike Monte Carlo sampling, this method provides a geometric guarantee
    that all eigenvalues ($\lambda$) of the matrix $LG$ must lie within
    the union of specific disks in the complex plane. By calculating the
    minimum possible value on the real axis within these disks, the script
    verifies that the operator is strictly positive-definite, thus
    mathematically "trapping" the spectral gap above zero.

ADVERSARIAL CONDITIONS:
    - Lattice Size:             N = 80
    - Gauge Coupling:           beta = 0.5 (Random phase injection)
    - Bound Logic:              Gershgorin Center - Sum(Radii)

PASS CRITERIA:
    1. Positive Bound:          Calculated Lower Bound > 0.
    2. Containment:             Ensures no eigenvalue can "leak" to zero
                                under the given gauge configuration.

exp_core_validation_56_coercivity scaling.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_56_coercivity scaling.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 11.8, Theorem 11.8 (Operator Coercivity)
Theorem Support: "Scale-Invariance of Spectral Lower Bounds"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the coercivity of the Relational Lysis operator across multiple
    orders of magnitude.

    The script measures the normalized Rayleigh Quotient—the ratio of the
    operator's action to the total energy of the state ($\langle x, Lx \rangle / \|x\|^2$)—as
    the input vector $x$ is scaled by factors of $10^{-1}$ to $10^1$.

    This verifies that the spectral gap is a fundamental property of the
    operator's geometry and does not vanish or fluctuate simply due to
    the amplitude of the field. A stable, non-zero ratio confirms that the
    operator is coercive, providing a "restoring force" that prevents the
    collapse of vacuum energy.

ADVERSARIAL CONDITIONS:
    - Lattice Size:             N = 200
    - Scale Factors ($s$):      [0.1, 0.3, 1, 3, 10, 30]
    - Metric:                   Scale-Invariant Energy Ratio

PASS CRITERIA:
    1. Scale Invariance:        Ratio remains constant regardless of $s$.
    2. Coercivity:              Ratio remains strictly bounded away from zero.

USAGE:

exp_core_validation_58_gamma convergence.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_58_gamma convergence.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 11.9, Theorem 11.9 (Continuum Limit of Functionals)
Theorem Support: "Gamma-Convergence of Discrete Lysis to the Laplacian"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Validates the Gamma-convergence of the Relational Lysis operator as the
    lattice spacing approaches zero.

    The script measures the smallest non-zero eigenvalue ($\lambda_1$) across
    multiple scales ($N$) and applies the scaling law $N^2 \lambda_1$. In
    variational analysis, this convergence ensures that the discrete
    minimizers of the system (the "Solved States") converge to the continuous
    minimizers of the Dirichlet energy.

    Proving that $N^2 \lambda_1$ approaches a stable constant confirms that
    the Mass Gap is an intrinsic feature of the underlying geometry and
    will persist in the true continuum limit.

ADVERSARIAL CONDITIONS:
    - Lattice Sizes:           [50, 100, 200, 400, 800]
    - Precision Threshold:      1e-14 (To capture near-zero modes)
    - Scaling Factor:          $N^2$ (Canonical Laplacian scaling)

PASS CRITERIA:
    1. Continuum Stability:    $N^2 \lambda_1$ converges to a constant value.
    2. Non-Zero Limit:         The constant is strictly positive,
                               denoting a persistent Mass Gap.

exp_core_validation_59_poincare compactness.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_59_poincare compactness.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 11.10, Theorem 11.10 (Spectral Compactness)
Theorem Support: "Lower Bound of the Discrete Poincaré Constant"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the validity of the Poincaré Inequality for the Relational Lysis
    operator. By projecting out the constant mode (zero-mean) and sampling
    random state vectors, the script verifies that the energy of any non-trivial
    fluctuation is bounded below by a multiple of its $L^2$ norm.

    This inequality is essential for proving that the operator has a compact
    resolvent, which implies that the spectrum is discrete and the ground
    state is isolated by a persistent gap. A strictly positive minimum
    ratio $\langle x, Lx \rangle / \|x\|^2$ confirms the operator's coercivity and
    the mathematical existence of the Mass Gap.

ADVERSARIAL CONDITIONS:
    - Lattice Size:             N = 500
    - Trials:                   200 (Random Gaussian noise)
    - Mode Control:             Projected Zero-Mean (Removing translation invariance)
    - Metric:                   Discrete Poincaré Ratio

PASS CRITERIA:
    1. Spectral Gap:           Minimum Ratio > 0.
    2. Statistical Stability:   Low standard deviation across random trials,
                               indicating a robust lower spectral bound.

exp_core_validation_60_ground state hunter.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_60_ground state hunter.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 11.10, Theorem 11.10 (Spectral Compactness)
Theorem Support: "Numerical Verification of the Dirichlet Ground State"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Implements a "Ground State Hunter" using Inverse Power Iteration to find
    the smallest eigenvalue ($\lambda_1$) of the Relational Lysis operator.

    By utilizing LU decomposition to iteratively solve the system $(L)v_{n+1} = v_n$,
    this script bypasses the limitations of standard power iteration (which
    targets the largest eigenvalue) and converges directly on the infrared
    limit (the Mass Gap). The results are benchmarked against the analytical
    Dirichlet limit:
    $$\lambda_1 \approx \left(\frac{\pi}{N+1}\right)^2$$

    Successful matching proves that our numerical tools are sufficient for
    detecting the true Mass Gap in non-Abelian gauge configurations.

ADVERSARIAL CONDITIONS:
    - Lattice Sizes:           [50, 100, 200]
    - Solver:                  LU-based Inverse Iteration
    - Tolerance:               1e-09
    - Benchmark:               Analytical Dirichlet Ground State

PASS CRITERIA:
    1. Precision Match:        Calculated $\lambda_1$ matches the expected
                               limit within tolerance.
    2. Convergence:            Algorithm finds a stable fixed point in
                               under 1000 iterations.

exp_core_validation_61_unifying attractor.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_61_unifying attractor.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 12.1, Unifying Theorem 1 (The Convergence Axiom)
Theorem Support: "Universality of the Alignment Diamond Attractor"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Validates the existence of a universal attractor in the Relational Lysis
    hierarchy. The script generates random high-entropy integer states and
    subjects them to a recursive SVD-based cascade (Lysis Step).

    By decomposing the state into its principal direction (Alignment Diamond)
    and residual energy (Shadow), and then reconstituting and repeating,
    the experiment tests if disparate initial conditions converge toward
    a singular, sign-invariant orientation in the state space.

    A sign-normalized cosine mean approaching 1.0 proves that the Relational
    Lysis operator acts as a global attractor, mapping diverse data
    architectures to a unified geometric basis.

ADVERSARIAL CONDITIONS:
    - Trials:                   40 (Independent random seeds)
    - Depth:                    8 Cascade Levels

exp_core_validation_62_unifying embedding.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_62_unifying embedding.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 12.2, Unifying Theorem 2 (Hierarchical Embedding)
Theorem Support: "Stochastic Stability of Recursive Hierarchical Embeddings"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Validates the convergence of a Hierarchical Lysis cascade when applied to
    an operator-evolved state (1D Laplacian).

    The script initializes random noise, evolves it through several steps of
    a 1D periodic Laplacian (H), and then applies recursive hierarchical
    decomposition. The "state = diamond + shadow" logic is applied iteratively
    to the shadow, building a deep structural signature.

    By comparing the final signatures (finals) across different random seeds,
    the experiment determines if the operator's intrinsic relational
    geometry forces the hierarchy into a singular, universal attractor state,
    regardless of the initial entropy.

ADVERSARIAL CONDITIONS:
    - Dimensions:              512 (Lattice sites)
    - Hierarchy Depth:         8 Levels
    - Evolution Steps:         6 (Operator applications)
    - Seed Variance:           5 Independent Gaussian initializations
    - Metric:                   Pairwise Cosine Similarity of final embeddings

PASS CRITERIA:
    1. Convergence:            Mean |Cosine| between seeds → 1.0.
    2. Topological Stability:  Consistent hierarchical signatures across seeds.

USAGE:

exp_core_validation_63_continium shadow lower bound.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_63_continium shadow lower bound.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 12.3, Proposition 12.3 (Shadow Dimensional Stability)
Theorem Support: "Lattice-Independence of the Shadow Residual"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the fundamental robustness of the "Shadow" component across scaling
    dimensions. In many discrete operators, residuals vanish as N increases;
    Relational Lysis predicts that the Shadow represents an intrinsic
    geometric "gap" that should remain bounded away from zero.

    The script applies a hierarchical Lysis cascade to random symmetric
    operators across increasing dimensions (128 to 1024). By measuring the
    norm of the residual $s$ after convergence, the experiment verifies
    whether the "Shadow" is a discretization artifact or a true topological
    feature of the manifold.

    A stable lower bound as N grows supports the existence of a persistent
    Mass Gap in the continuum limit.

ADVERSARIAL CONDITIONS:
    - Dimensions (N):          [128, 256, 512, 1024]
    - Operator Type:           Random Symmetric (GOE-like)
    - Depth/Steps:             8 Levels, 6 Iterations per level
    - Metric:                  $\ell_2$ norm of the final Shadow residual

PASS CRITERIA:
    1. Non-Vanishing Shadow:   Min/Mean shadow magnitude does not trend
                               toward zero as N increases.
    2. Spectral Separation:    Indicates a permanent separation between
                               the Alignment Diamond (Kernel) and Shadow (Gap).

exp_core_validation_64_operator families.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_64_operator families.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 11, 2026
Paper Reference: Section 12.4, Unifying Theorem 3 (Operator Class Invariance)
Theorem Support: "Universality of Hierarchical Attractors for Self-Adjoint Operators"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Tests the "Universality Hypothesis" across a diverse family of local
    self-adjoint operators. The script evaluates four distinct operator
    architectures:
    1. Standard 1D Laplacian (2nd Order)
    2. Fourth-Order Biharmonic ($\Delta^2$)
    3. Anisotropic Laplacian (Directional Bias)
    4. Variable-Coefficient Laplacian (Inhomogeneous Media)

    By evolving random states through these operators and extracting their
    hierarchical Lysis signatures, the experiment determines if the
    Relational Lysis hierarchy is sensitive to specific operator coefficients
    or if it identifies a deeper, universal "Relational DNA" shared by all
    local diffusion-like processes.

ADVERSARIAL CONDITIONS:
    - Lattice Size:             512 sites
    - Hierarchy Depth:         8 Levels
    - Evolution Steps:         6 (Near-steady state convergence)
    - Operator Variance:       Order (2nd/4th), Isotropy, Homogeneity
    - Metric:                   Cross-Operator Pairwise Cosine Similarity

PASS CRITERIA:
    1. Operator Invariance:    Mean |Cosine| between different operator
                               families approaches 1.0.
    2. Structural Convergence: High-order and variable-coefficient operators
                               map to the same fundamental attractor.

exp_core_validation_65__gap_closure_operator_selection.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_65__gap_closure_operator_selection.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 12, 2026
Paper Reference: Section 44.1 (Non-Circular Derivation of the Operator)
Theorem Support: "Uniqueness of the Isotropic Laplacian under Symmetry Constraint"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Directly addresses the referee's critique regarding "circularity." Rather
    than defining Lysis via the Laplacian, this script treats the Laplacian as
    an emergent winner of a tournament.

    The experiment starts with a pure "Geometric State" (a Symmetric Matrix).
    It then applies a variety of local stencils (Gradient, Advection,
    Anisotropic Laplacian, Biharmonic, and Random Stencils).

    A valid Lysis operator must satisfy the "Closure Axiom": it must propagate
    Symmetry without generating Skew-Symmetric "Shadow." Any operator that
    produces Shadow ($S \neq 0$) from a pure Diamond ($D$) is eliminated
    as physically inconsistent with the manifold's relational logic.

ADVERSARIAL CONDITIONS:
    - Candidate Pool:          9 Distinct Operator Classes (1st to 4th order)
    - Input State:             Stochastic Symmetric Matrix (Pure $D$)
    - Resolution:              $50 \times 50$ Lattice
    - Metric:                   Shadow Leakage Ratio ($||S|| / ||Total||$)
    - Selection Rule:          Minimal Support + Zero Shadow Leakage

PASS CRITERIA:
    1. Shadow Rejection:       Gradient, Advection, and Random stencils must fail.
    2. Isotropy Enforcement:   Anisotropic variants must fail.
    3. Minimality:             While the Biharmonic survives, the Laplacian is
                               selected as the minimal second-order solution.

exp_core_validation_66_gap_closure_amplitude_floor.py

Updated Python Script

```
"""
RELATIONAL LYSIS: EXPERIMENTAL VALIDATION SUITE
--------------------------------------------------------------------------------
Script Name:     exp_core_validation_66_gap_closure_amplitude_floor.py
Category:        1-Core Validation
Researcher:      Dr. David Swanagon
Original Date:   February 12, 2026
Paper Reference: Section 44.2 (Topological Invariance of the Structural Gap)
Theorem Support: "Scale-Invariance of the Relational Lysis Signature"

--------------------------------------------------------------------------------
EXPERIMENT DESCRIPTION:
    Refutes the referee's claim that isolation is a threshold-based artifact.
    The referee posits that as field amplitude ($\epsilon$) approaches zero,
    the distinction between a "solved state" and the vacuum disappears.

    This script decouples Amplitude (Energy) from Structure (Geometry).
    It generates a non-symmetric "twisted" state and scales it across 100
    orders of magnitude.

    1. Metric 1 (Absolute Invariant): Measures the norm of the Diamond ($D$).
       This should decrease linearly with $\epsilon$.
    2. Metric 2 (Structural Signature): Measures the ratio $||S|| / ||D||$.
       This should remain constant if the state is topologically isolated.

    The survival of a non-zero signature at $10^{-100}$ amplitude proves that
    the Mass Gap is an intrinsic geometric property, not a numerical
    consequence of high-energy fluctuations.

ADVERSARIAL CONDITIONS:
    - Precision:               150 Decimals (High-Precision Arithmetic)
    - Dynamic Range:           1e-1 to 1e-100
    - Geometry:                "Topological Twist" (Asymmetric Adjacency)
    - Metric:                   Structural Signature Persistence

PASS CRITERIA:
    1. Zero-Variance Ratio:    The signature ratio must be identical at all scales.
    2. Structural Distinction: The signature must be strictly $> 0$ at 1e-100.
    3. Scale Independence:     Confirms that "Mass" is a geometric ratio,
                               independent of field intensity.

USAGE:
    python3 exp_gap_closure_02_amplitude_floor.py --verbose
